
Graphical User Interface in JDE robot applications

José M. Cañas & Vicente Matellán

*First Int. Workshop on TELEROBOTICS and
Augmented Reality for TELEOPERATION*

Contents

- Introduction
- Design of visualization in JDE
- Examples
- Conclusions

Introduction

Why do we need GUI in robot applications?

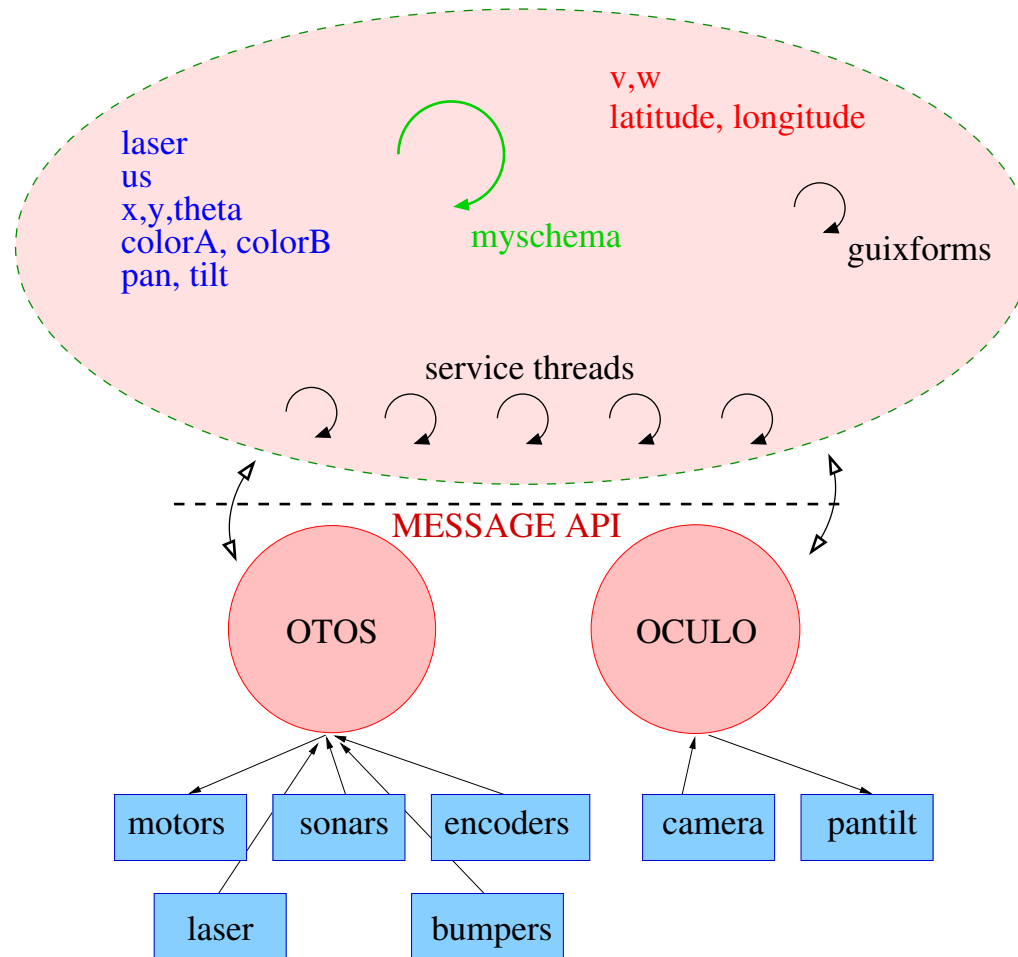

- Debugging
 - See sensor readings
 - See internal data
 - Command actuators
 - Change internal values
- Behavior is the main issue, not the GUI
- It should not disturb autonomous operation

Design of visualization in JDE

- Robot application is a set of schemas
- Each schema is implemented as a thread with iterative execution
- There is one schema for GUI
 - refresh display with new data
 - check for user interaction (buttons, sliders...)
- Its iteration frequency is under control
- Remote GUI: remote servers oculo and otos
- X-Window system on Linux: Qt, GTK+, XForms,...

Remote GUI

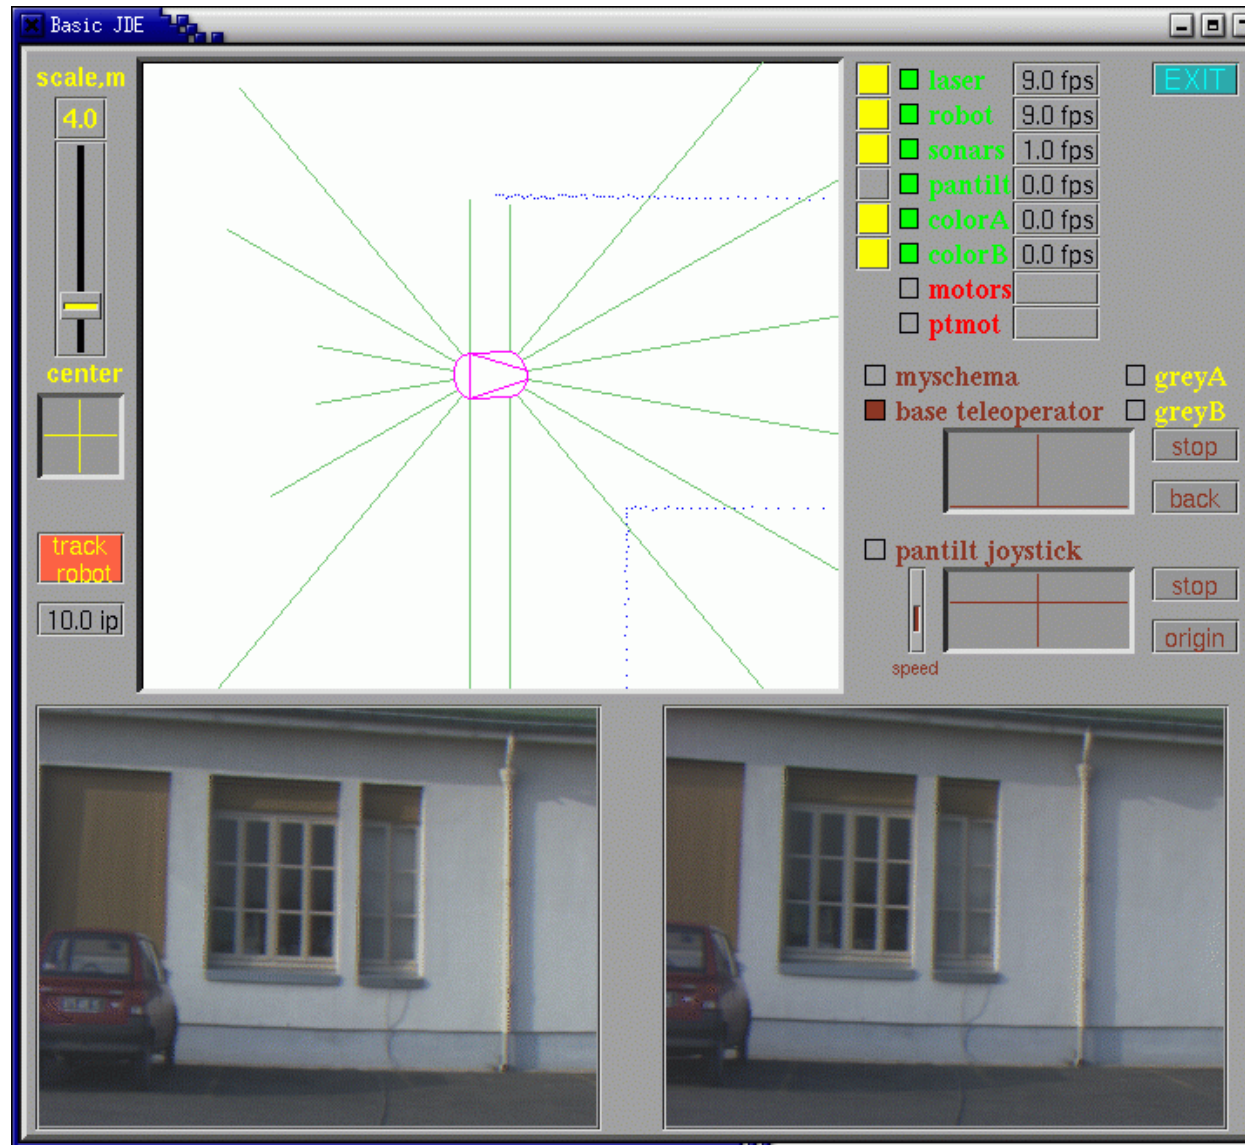

XForms library

- Non-blocking mode of operation
- Pool of graphic objects for GUI
 - canvas
 - images
 - sliders
 - positioner
 - text input/output
 - ...

Examples

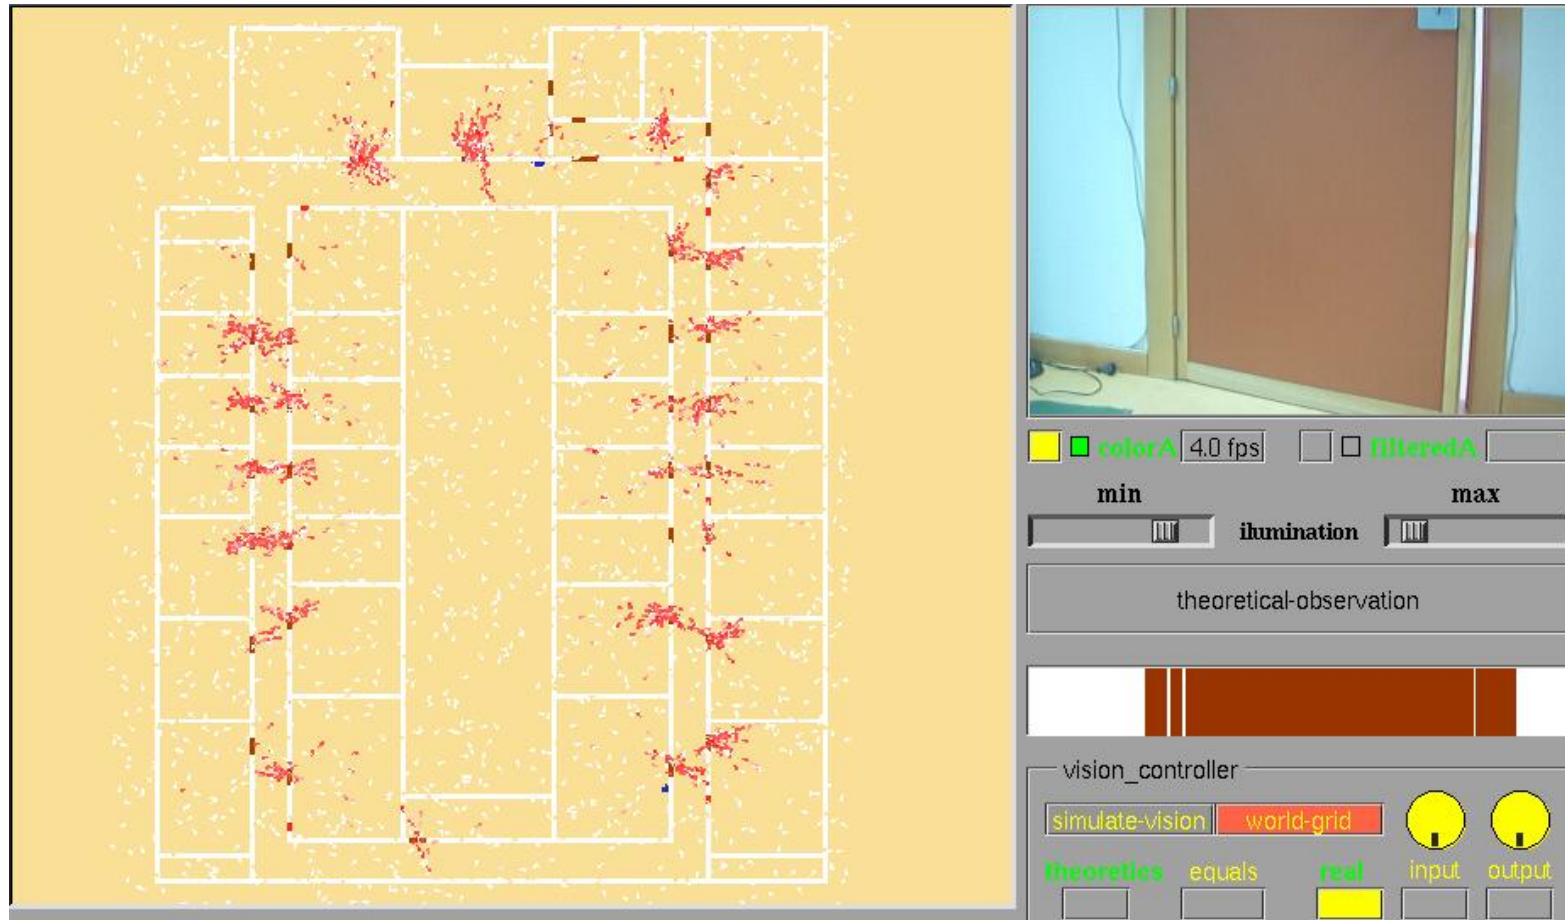

- Teleoperation and sensor readings
- Maps, grids and route planning
- 2D and 3D particles
- Several cameras and filtered colors
- Composed scene and temporal evolution

Maps, grids and route planning

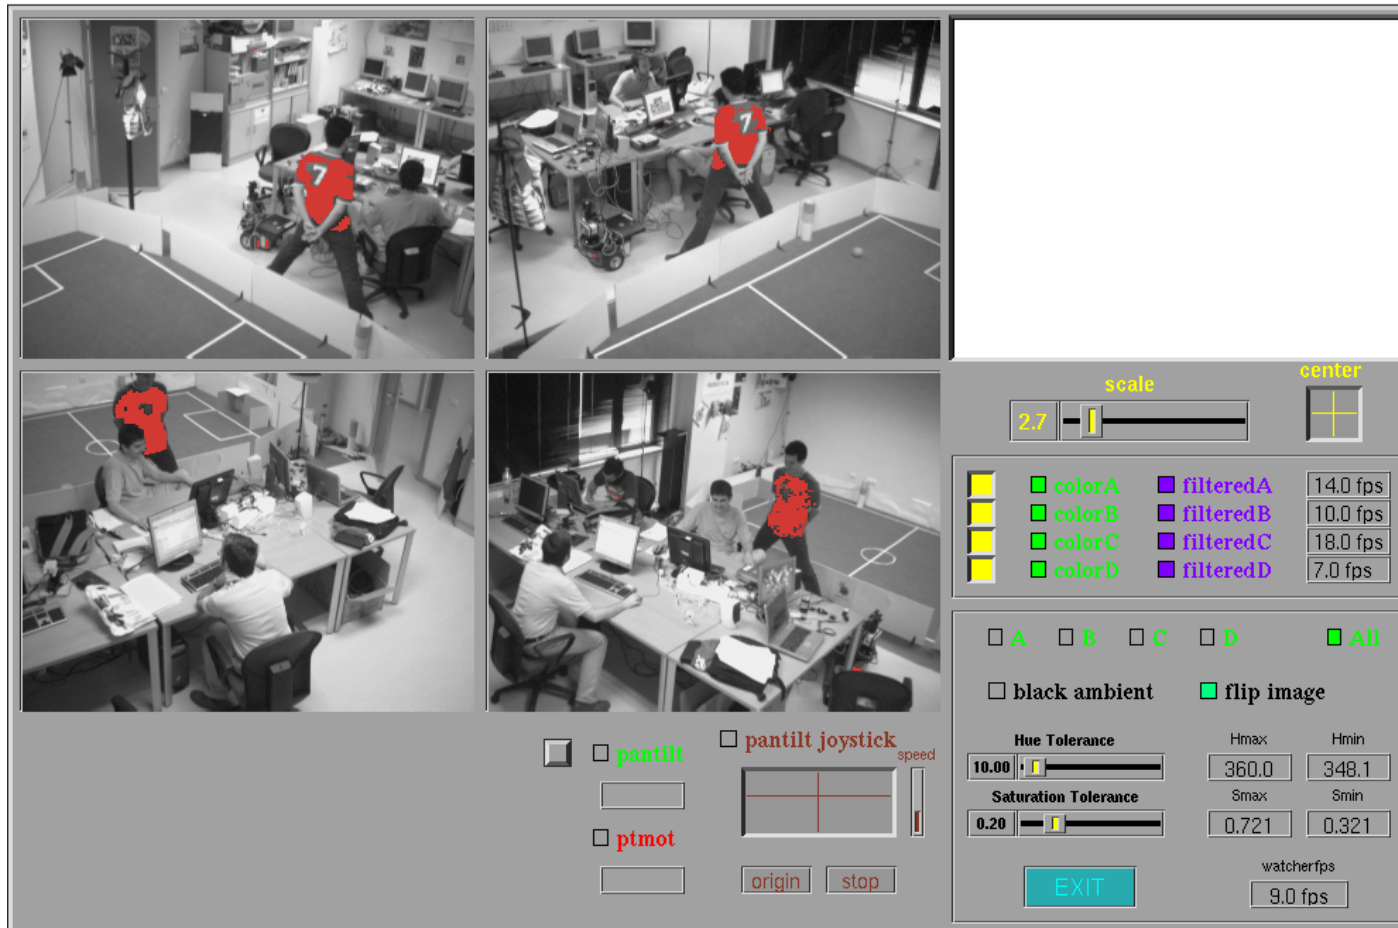

2D particles

3D particles

Several cameras and filtered color

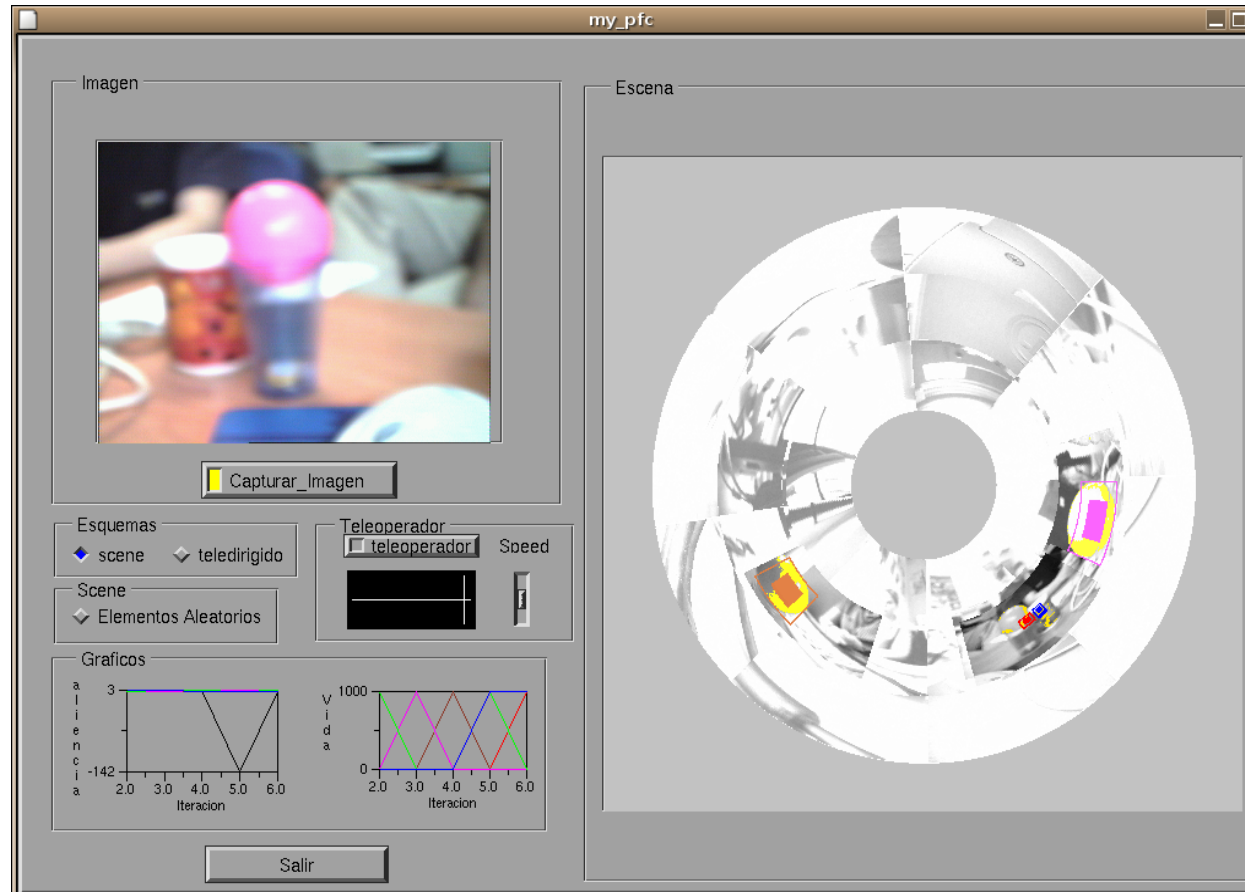

The interface displays four camera feeds of a robot in a room. The control panel includes:

- scale:** 2.7
- center:** A crosshair icon.
- Color Filter Table:**

<input type="checkbox"/>	colorA	<input type="checkbox"/>	filteredA	14.0 fps
<input type="checkbox"/>	colorB	<input type="checkbox"/>	filteredB	10.0 fps
<input type="checkbox"/>	colorC	<input type="checkbox"/>	filteredC	18.0 fps
<input type="checkbox"/>	colorD	<input type="checkbox"/>	filteredD	7.0 fps
- View Options:**
 - A B C D All
 - black ambient flip image
- Tolerance Sliders:**
 - Hue Tolerance:** 10.00 (Hmax: 360.0, Hmin: 348.1)
 - Saturation Tolerance:** 0.20 (Smax: 0.721, Smin: 0.321)
- Buttons:** EXIT, pantipt, pantipt joystick (with speed slider), ptmot, origin, stop.

Composed scene and temporal evolution

Conclusions

- Processing time devoted to GUI is under control in JDE robot applications
- GUI can be disabled without recompiling
- Debugging is easy with JDE programmed GUIs
- Future: visualization of 3D data using virtual camera, OpenGL
