

Concurso al Cuerpo de
Catedráticos de Universidad
Plaza: Y158/DF005206/16-10-2017

Jesús M. González Barahona

Universidad Rey Juan Carlos

30 de noviembre de 2017

“Los concursos de acceso de Catedráticos de Universidad constarán de una única prueba, que se celebrará en sesión pública en las dependencias de la Universidad Rey Juan Carlos, y que consistirá en la exposición oral durante un tiempo máximo de hora y media del historial académico, docente e investigador del candidato, así como de su proyecto docente e investigador, otros méritos que en él concurran y su adecuación al perfil de la plaza.”

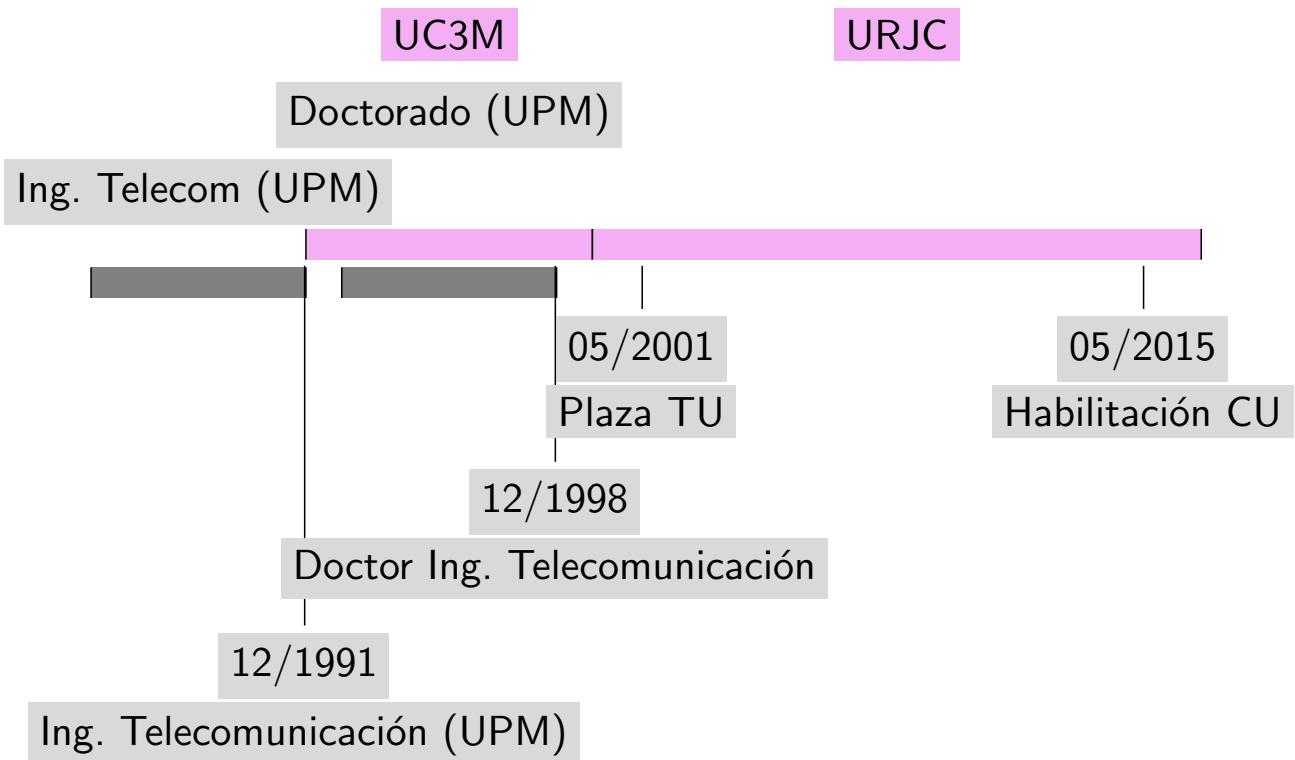

Resolución de 17 de octubre de 2017, de la URJC

Laboratorios con software libre (1993-2005)

Libre Software for Computer Science Classes

In 1993, the authors began using 386BSD to teach computer science classes at Madrid's Carlos III University, in Spain. Seven years later, NetBSD and GNU/Linux are the operating systems of choice for several of the University's computer science teaching laboratories.

Jesús M. González-Barahona, Pedro de-las-Heras-Quirós, José Centeno-González, Vicente Matellán-Olivera, and Francisco J. Ballesteros, *King Juan Carlos University, Spain*

During 1991 and 1992, the landscape of libre software, and of software development in general, was ready for a change. In two different communities, two very exciting events were taking place: 386BSD, a libre derivative of the BSD code, was born, and Linus Torvalds distributed the first versions of the Linux kernel. Soon after, the software community had two libre operating systems at its disposal (for some basic references to online information on libre products and distribution, see the "Online Resources" and "Terminology" sidebars).

In late 1992 at Carlos III University, we were introducing new computer science studies and planning a distributed systems course. We were looking for a software platform suitable for practical lectures on distributed systems (our practical lectures take place in a computer lab and usually involve a programming exercise). Unfortunately, we couldn't afford workstations—we could only share a PC laboratory running MS-DOS, used to teach other computer science subjects. Therefore, we were pleased to discover that 386BSD could run on those PCs and already had the complete environment we needed for the practical lectures. We decided to give the new, exciting libre operating systems a chance—

both GNU/Linux and 386BSD were reasonably stable platforms.

History of the Unix Lab

After a testing period, we established a stable environment that several students helped us maintain and improve. When the semester started, a small group of around 20 students used 386BSD to learn to build client-server applications. The experiment was a success. The students, using the environment, were productive and fulfilled the goal we had set: to build simple RPC-based applications. 386BSD exposed them to a system similar to Unix workstations but at a fraction of the cost and with many new features—such as access to source code.

Countando patatas (2000-2001)

Counting Potatoes: the Size of Debian 2.2

Jesús M. González-Barahona, Miguel A. Ortuño Pérez, Pedro de las Heras Quirós, José Centeno González and Vicente Matellán Olivera

Debian is the largest Free Software distribution, with well over 2,800 source packages in the latest stable release (Debian 2.2) and more than 4,000 source packages in the release currently in preparation. But, how large is “the largest”? In this paper, we use David Wheeler’s sloccount system to determine the number of physical source lines of code (SLOC) of Debian 2.2 (aka Potato). We show that Debian 2.2 includes over 56,000,000 physical SLOC (almost twice than Red Hat 7.1, released about 8 months later), showing that the Debian development model (based on the work of a large group of voluntary developers spread around the world) is at least as capable as other development methods (like the more centralized one, based on the work of employees, used by Red Hat or Microsoft) to manage distributions of this size.

WP3 - Database

The FLOSSMetrics project

FLOSSMetrics stands for Free/Libre Open Source Software Metrics.

The main objective of FLOSSMETRICS is to construct, publish and analyse a large scale database with information and metrics about libre software development coming from several thousands of software projects, using existing methodologies, and tools already developed. The project will also provide a public platform for validation and industrial exploitation of results.

FLOSSMetrics targets

- Identify and evaluate sources of data and develop a comprehensive database structure, built upon the results of CALIBRE
- Integrate already available tools to extract and process such data into a complete platform
- Build and maintain an updated empirical database applying extraction tools to thousands of open source projects
- Develop visualisation methods and analytical studies, especially relating to benchmarking, identification of best practices, measuring and predicting success and failure of projects, productivity measurement, simulation and ...

Stefano Maffulli, OpenStack

Gregorio Robles, Universidad Rey Juan Carlos

progress of new analytics techniques to study them. In turn, these techniques have started to produce useful results for both practitioners and other stakeholders.²

In particular, studies of company participation in large projects have started to raise industrial interest: FLOSS foundations want to learn about company participation in their projects, and the companies want to know more about corporate activity in the projects on which they rely. Here, we present two studies in this area—by LibreSoft, a research group specializing in the quantitative analysis of software development, and Bitergia, a LibreSoft spin-off company focused on software analytics services—into company activity in OpenStack and the fairness of WebKit's review process.

Characterizing Company Participation

Although corporate contributions have always played a role in FLOSS projects, the emergence of “communities of companies” is driving an interest in analyzing company behavior. Although this new kind of community admits individual contributions, it

communities work with companies that use their output,

it's especially important for both parties to understand how

MetricsGrimoire (2002-2015)

MetricsGrimoire

Tools for software & development community analytics

@ GitHub

Update: Check the new GrimoireLab platform

MetricsGrimoire

[Update]: Currently, main development related with *MetricsGrimoire* has stopped. Main contributors are working on a new platform: **GrimoireLab**

MetricsGrimoire (pronounced /'metriksgrim'war/) is a toolset to obtain data from repositories related to software development: source code management (aka *version control*), issue tracking (aka *bug reporting*) systems, mailing lists, etc. Data and metadata about the software development processes is retrieved from those repositories (information about commits, ticket management, communication in mailing lists, etc.), and then organized and stored into SQL databases that can later be mined for specific patterns or summaries of activity.

MetricsGrimoire tools support many kinds of repositories, including those provided by GitHub (git & GitHub issue tracking).

Proyecto investigador

Summary

“Methodology & tools to support decision making to improve time-to-merge of software changes, from requirements to complete and correct implementation.”

Applicability universe

“Software development projects following continuous delivery practices, and oriented to continuous deployment”

- complete traceability of changes
- pre-commit code review
- automated testing

Scope

“When it is important to minimize time-to-deployemt and time-to-merge, while at the same time it is needed to keep high quality standards”

- minimize the rate of bug seeding
- minimize iterations until complete implementation

Hypotesis

“Metrics about the whole process can be obtained automatically from information in the relevant software repositories.

These metrics can be useful to fine tune, and act upon, the different acts involved in the discussion, implementation and testing of proposed changes.

This allows to make decisions to optimize the full project from change proposal to change implementation.”

Specific goals

- Tools
- Data sets
- Estimation of time-to-merge
- Estimation of quality
- Determination of influencing factors
- Complete methodology

Iterations

- First: ElasticSearch & OpenStack, preliminary tools & datasets
- Second: Some more projects, generic tools & datasets, estimations
- Third: More projects complete methodology

Barbican

[Log in / Register](#)

[Overview](#) [Code](#) [Bugs](#) **[Blueprints](#)** [Translations](#) [Answers](#)

Add support to order new and modify existing SSL certs.

Registered by [Chad Lung](#) on 2014-02-18

This blueprint addresses support of ordering (new) and modification (existing) of SSL certificates from both globally rooted and internal certificate authorities through Barbican.

This blueprint would address changes needed to the Barbican orders resource as well as any other new resources that might be required. In addition, a schema would need to be created to track the SSL Certificate data and state as it progresses through the certificate authority's workflow.

Barbican would also require the ability to raise notifications/events to plugins that would handle the interaction between the CA and any other concerned endpoint (ie: a ticketing system). Initial information exists on the Barbican wiki for an eventing system: <https://github.com/cloudkeep/barbican/wiki/Blueprint:-Events>

(March 31, 2014) Additional details can be found on the wiki page: <https://wiki.openstack.org/wiki/Barbican/Blueprints/ssl-certificates>

OpenStack: example of blueprint

Whiteboard

Gerrit topic: <https://review.openstack.org/#q,topic:bp/add-ssl-ca-support,n,z>

Addressed by: <https://review.openstack.org/95023>

Initial files for SSL Certificate processing

Addressed by: <https://review.openstack.org/107190>

Add Certificate Interface & Symantec Plugin

Addressed by: <https://review.openstack.org/115301>

Add initial files for certificate event handling

Addressed by: <https://review.openstack.org/115715>

Initial connect orders resource to certificate processing

Addressed by: <https://review.openstack.org/116078>

Add order plugin metadata entity and logic

Addressed by: <https://review.openstack.org/116956>

Additional work on certificate processing

OpenStack: example of code review

History Expand All

Chelsea Winfree	Uploaded patch set 1.	Jul 16, 2014
Juan Ant...o Robles	Patch Set 1: Code-Review-1 I would rather have the abstract state machine classes in a separate commit. Instead of having them together with the symantec plugin stuff.	Jul 16, 2014
John Wood	Patch Set 1: Juan, I think every plugin implementation will be different, so I don't know how much common/shared code could be refactored out. Ade, would a Dogtag CA pl...	Jul 16, 2014
John Wood	Patch Set 1: Following up on this one...I think the only reusable part is the <code>_get_state_from()</code> logic around line #137. The rest of the logic I think will be pretty specific to a ...	Jul 16, 2014
Juan Ant...o Robles	Patch Set 1: -Code-Review	Jul 16, 2014
Yang Li	Patch Set 1: Code-Review+1	Jul 17, 2014
Steve Heyman	Patch Set 1: (5 comments) see comments barbican/plugin/interface/certificates.py Line 95: Can an implementer of a plugin return a value, or does it have to be none? Line 117: is this true? Would someone who implements this return none? Line 133: are these event objects, or functions to raise these events? Line 174: same as above - is None the only possibility for plugins? Line 182: add <code>:param</code> and <code>:returns</code> here to be consistent	Jul 17, 2014 ↔
Douglas Mendizábal	Patch Set 1: Code-Review-1 (3 comments) Commit Message Line 8: Please add: Implements: blueprint add-ssl-ca-support Also, change topic branch to <code>bp/add-ssl-ca-support</code> barbican/plugin/interface/certificates.py Line 23: Nit: insert blank line between different groups of imports. Line 95: +1 <code>:returns: None</code> is not very helpful here. If there is nothing to return, then leave the <code>:returns:</code> part out.	Jul 17, 2014 ↔

OpenStack: example of code review

Juan Antonio Osorio Robles	Patch Set 15: Code-Review-1 (2 comments) barbican/plugin/interface/certificate_manager.py Line 153: Yeah... Actually now that you mention it, I had completely forgotten about the existence of Enum in python :o barbican/tests/plugin/test_symantec.py Line 33: ++	Aug 7, 2014 ↔
Chelsea Winfree	Uploaded patch set 16.	Aug 7, 2014
Chelsea Winfree	Patch Set 15: (3 comments) barbican/plugin/interface/certificate_manager.py Line 24: done. edited <code>secret_store.py</code> also to conform to standard Line 75: done. Line 153: enum is not in global requirements for openstack, so we cant use it here :(Aug 7, 2014 ↔
Juan Ant...o Robles	Patch Set 16: Code-Review+1	Aug 7, 2014
Ade Lee	Patch Set 16: Code-Review+2	Aug 7, 2014
John Vrbanac	Patch Set 16: Code-Review+2	Aug 8, 2014
Yang Li	Patch Set 16: Code-Review+1	Aug 8, 2014
John Wood	Patch Set 16: Workflow+1	Aug 8, 2014
Chelsea Winfree	Uploaded patch set 17.	Aug 8, 2014
Paul Kehrer	Patch Set 17: Workflow+1	Aug 8, 2014
Jenkins	Change has been successfully merged into the git repository.	Aug 8, 2014

GrimoireLab: general overview

Schedule

Task	Quarters										
T1	█										
T2	█	█	█	█	█	█	█	█	█	█	█
T3	█	█	█	█	█	█	█	█			
T4			█	█	█	█	█	█			
T5			█	█	█	█	█	█	█	█	█

- T1: Kick-off
- T2: Management
- T3: First iteration
- T4: Second iteration
- T5: Third iteration

Milestones & deliverables

Milestone	Name of milestone	Date (month)	Deliverable
M1	Kick-off activities complete	3	
M2	First iteration finished	12	D2.1: tools (1st version) D2.2: data sets (1st version) D2.3: First, very limited, methodology D2.4: First iteration report
M3	Second iteration finished	24	D3.1: tools (2nd version) D3.2: data sets (2nd version) D3.3: Second methodology D3.4: Second iteration report
M4	Third iteration, and project, finished	36	D4.1: tools (3rd version) D4.2: data sets (3rd version) D4.3: Final methodology D4.4: Final project report
